

EXACQVISION FROM ZONE

NOW available from Zone Advanced Protection Systems is the exacqVision network digital video recorder, a hybrid solution specifically designed to merge IP and analogue cameras into a seamless and highly modular solution.

ZONE Advanced Protection Systems is distributing the powerful exacqVision Network Digital Video Recorder, a hybrid networked DVR that brings IP and analogue cameras together in a single interface. The exacqVision family includes 32 analogue inputs and 8 IP inputs, and there are 16/8 input versions as well as a 4/4 input system.

At the top end is the exacqVision Pro 32/8 channel hybrid which has a global frame rate of 960 images per second. Performance is strong, with this camera delivering 4CIF resolution at 25 ips on all channels. The system employs hardware compression on all analog cameras using MPEG-4, with inputs terminating at a 2U 19-inch chassis.

Along with support for analog cameras, the exacqVision solution offers support for standard, PTZ and megapixel IP cameras from makers like Axis, Sony, Arecont and IQinvision. It's possible to add up to 64 IP cameras per server.

Client server architecture gives stability and security while the mix and match exacqVision IP and exacqVision Pro systems allow easy addition of IP and Analog cameras for a hybrid, scalable enterprise video surveillance system, from one camera to hundreds.

The user interface is common to both systems, whether they be analog or IP, or both. The user interface allows simultaneous record, playback, and search and there's also POS/ATM Integration. The powerful text insertion and indexing allow for POS and ATM video and transaction recording.

There are extensive Input/Outputs including 16/32 video inputs, a multiplexed video output, alarm inputs and outputs, audio, serial ports (RS-232 & 485) for POS/ATM and PTZ, and API for third-party integration of video analytic software and access control systems.

The exacqVision family is enhanced by the release of Version 2.6 of the exacqVision IP video surveillance software. Key features in the Version 2.6 release include exacqReplay - instant right-click replay from any camera view, joystick support - added support for all USB joysticks for PTZ functionality, Arecont 5100 support - 5 Megapixel IP camera, improved Axis integration a new 6x5 widescreen view, shortcut function key support - function keys for help, hide navigation panel, hide toolbar, and full screen.

With exacqReplay you can right-click on any live window and see the last few seconds or minutes of video recorded on that camera. exacqReplay then pops up a window showing that camera's video for the selected time.

The window can be resized and displayed in-line or on another monitor. The video selection can be "scrubbed" back and forth, and you can step through the clip frame by frame, both forward and backward. You can also right-click to bring up a menu where you can save individual images, video clips, and even burn directly to a CD-R or DVD-RAM.

Another good feature is the addition of support for USB joysticks to control the PTZ functions within exacqVision client. Using a USB joystick, you can control not only specific PTZ cameras, analog or IP, but also control fixed camera PTZ using digital PTZ functionality. ▀ ▀ ▀
